The **CASAS Tutor™** series provides step-by-step instruction and targeted practice for the CASAS Content Standards and Adult Education College and Career Readiness Standards assessed on the CASAS GOALS tests. All practice items are aligned to CASAS Competencies and presented in a format that mirrors the CASAS GOALS test items to familiarize students with the test format.

**CASAS Tutor™ Math** books have five units covering key math skills that adults need to succeed on the job and in life.

- Number Sense
- Algebra
- Geometry
- Measurement
- Statistics, Data Analysis, and Probability

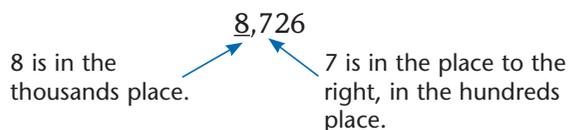

The **CASAS Tutor™ Practice** workbooks complement the **CASAS Tutor™** series and provide comprehensive skills practice for CASAS GOALS post-testing. Practice items are aligned to CASAS Competencies and mirror the format of CASAS GOALS test items to help students gain confidence and make level-to-level gains. All practice items are aligned to the CASAS Content Standards and Adult Education College and Career Readiness Standards assessed on the CASAS GOALS tests.

To estimate is to find an answer that is close to the exact answer. One way to estimate is to round. You can round whole numbers and decimal numbers to any place.

**Example** A parade was attended by 8,726 people. In its headline, the local newspaper rounded the attendance to the nearest thousand people. What number appeared in the headline?

1) Identify what place value you are rounding to. In this case, you are rounding to the thousands.

2) Look at the digit to the right of the rounding place.

3) Compare the hundreds digit to 5. If the digit is 5 or greater, round up to the next thousand.

Because 7 is greater than 5, add 1 to the thousands place and replace the digits to the right of the rounding place with zeros.

8,726 rounds to 9,000

The newspaper reported that 9,000 attended the parade.

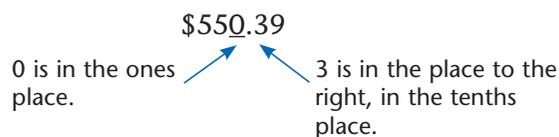

You can round decimals just as you would round whole numbers. Rounding numbers is a method used to estimate. To round a number to a particular place, look at the digit to its right.

- If it is 5 or more, round up.
- If it is less than 5, round down.

**Example** A new laptop costs \$550.39. A store wants to advertise the price using a whole number, and will round the price to the ones place. What number appears in the ad?

1) Identify the place value you are rounding to. In this case, you are rounding to the ones.

2) Look at the digit to the right of the rounding place.

3) Compare the tenths digit to 5. If the digit is less than 5, round down. Because 3 is less than 5, the ones place will stay the same and you can replace the digits to the right of the decimal point with zeros.

\$550.39 rounds to \$550.00

The store advertises the laptop as costing \$550.
